Unusually green

Eurofrigo's latest inverter, battery driven fridges for vans, have green features unusual for direct drive or diesel systems, and operators are said to see the battery driven fridges as a means to improving their own green credentials.

The all electric B2500XT and B2500 Skyline units are said to be particularly popular. The units are constructed as a single piece and have fewer components and less redundant or disposable parts, reducing the amount of 'hard waste' at the end of its life. Fully self contained, the electric units have no remote engine driven compressor, associated pipe work or brackets, parts responsible for about 70% of fridge failures in conventional units. The need for replacement parts is also reduced, so there is less need for recycling.
